SDET Automation Challenge

Context

Imagine you're a SDET Engineer working for a team at Google and the engineering team has just built a calculator tool that shows up when you search for the term "**calculator**".

Goal

Your goal is to build an automated end to end test suite that tests the functionality of this calculator component on Google. For this challenge imagine the calculator only has the buttons **0123456789.=+-×÷AC/CE** (all the buttons in the picture below that aren't blurred out). We use **Cypress.io** as our automation tool, but feel free to use whatever automation tool you are most familiar with to build your end-to-end automation tests.
